

VENTEK ENERGY SYSTEMS INC. TO REPRESENT EKOGEN OY IN CANADA

Ventek Energy Systems Inc. and Ekogen Oy of Finland are pleased to announce the signing of a working agreement to represent the Ekogen small scale CHP system in North America.

The sales and marketing agreement will also include further R&D activities specific to entry into the North American market place.

The Ekogen CHP system incorporates proven biomass combustion technology; Ekogen developed high temperature air to air heat exchangers, high speed gas turbine operating on clean air side of the cycle, air to water heat exchangers for the heating circuit and automation all built into modular containerized units. Initial size for a single unit would be 100kW_e and 400 kW_h with higher outputs for multiple units available.

The Ekogen system will be an excellent product line for communities that are off-grid and rely on diesel power generation for their electricity needs. It can be operated by regular boiler operators and will not require any steam or power engineering operator requirements.
